

FECAL METALS

LAB#: F000000-0000-0
PATIENT: Sample Patient
SEX: Male
AGE: 4

CLIENT#: 12345
DOCTOR:
Doctor's Data, Inc.
3755 Illinois Ave.
St. Charles, IL 60174

POTENTIALLY TOXIC METALS

METALS	RESULT mg/kg	REFERENCE RANGE	PERCENTILE		
			68 th		95 th
Mercury	0.037	<.05 w/o amalgams*			
Mercury	0.037	<.5 with amalgams*			
Antimony	0.105	< 0.080			
Arsenic	0.14	< 0.30			
Beryllium	0.007	< 0.009			
Bismuth	0.047	< 0.050			
Cadmium	0.24	< 0.50			
Copper	41	< 60			
Lead	2.57	< 0.50			
Nickel	5.3	< 8.0			
Platinum	< dl	< 0.003			
Thallium	0.008	< 0.020			
Tungsten	0.599	< 0.090			
Uranium	0.083	< 0.120			

% WATER CONTENT

	RESULT % H ₂ O	EXPECTED RANGE	MEAN			
			2SD LOW	1SD LOW	72.5%	1SD HIGH 2SD HIGH
% WATER CONTENT	77.3	60-85%				

DISCUSSION

Analysis of elements in feces provides a comprehensive evaluation of environmental exposure, accumulation and endogenous detoxification of potentially toxic metals. For several toxic elements such as mercury, cadmium, lead, antimony and uranium, biliary excretion of metals into feces is the primary natural route of elimination from the body. Studies performed at DDI demonstrate that the fecal mercury content and number of amalgam surfaces are highly correlated, as is the case for post-DMPS urine mercury levels and amalgam surface area.

Results are reported as mg/kg dry weight of feces to eliminate the influence of variability in water content of fecal specimens. The reference values that appear in this report have been derived from both published data and in-house studies at DDI. *Due to exposure to mercury in the oral cavity, people with dental amalgams typically have a considerably higher level of mercury in the feces than individuals without dental amalgams; therefore, two reference ranges have been established for mercury.

To provide guidance in interpretation of results, patient values are plotted graphically with respect to percentile distribution of the population base. Since this test reflects both biliary excretion and exposure (metals to which the patient is exposed may not be absorbed), it may not correlate with overt clinical effects. Further testing can assist in determining whether the metals are from endogenous (biliary excretion) or exogenous (oral exposure) sources.
